INTRODUCTION

Project Overview

For this project, we were tasked by our lecturer Mr. Khairil Imran Bin Ghauth to brainstorm a web application and subsequently implement it using the knowledge and skills that we have learnt throughout this subject to implement this system. We have come out with a project which helps manage a library called a library management system. For the Client-side scripting, we will be using HTML, CSS and JavaScript. While implementing the Server-side scripting, we will be using PHP. For managing the database, we will be using MySQL using queries such as insert, select, update and delete.

We will have 2 types of people that will be using our system, which are the 'Users' and also the "Admins". The 'Users' will be able to login to the system using their credentials and they are able to see a list of books that are available for borrowing, the books' information will also be visible to them. While the 'Admins' are able to create new 'Users', add new books to the database and also change the status of the books. For example if a book is damaged or in repair, the admin can manually change the books' status to 'Unavailable' to prevent the 'Users' from being able to borrow it.

Problem Statement

With the current pandemic going on, libraries tend to be more difficult and inconvenient to visit in person. An improved online system can help the general public to check the book they want to borrow in advance without having to spend too much time out in the library. It will significantly reduce the risk of someone contracting or spreading COVID-19. This system will surely play an important role in curbing the spread of COVID-19 in our country while increasing the efficiency of a library's management process.

Objective

In order to successfully implement this library management system, we have come up with three main objectives that we will to achieve in order to steer our development in the right direction. These objectives include:

- To increase convenience for library users to check for books they want to borrow
- To keep up with the increasing demand for online library systems as physical search for books are hard during the pandemic
- To keep track of the user's late fees remotely

Scope

This project involves building a library management system for the use of 2 types of roles, namely the 'Admin' and 'User. Some functions for the 'Admin' include:

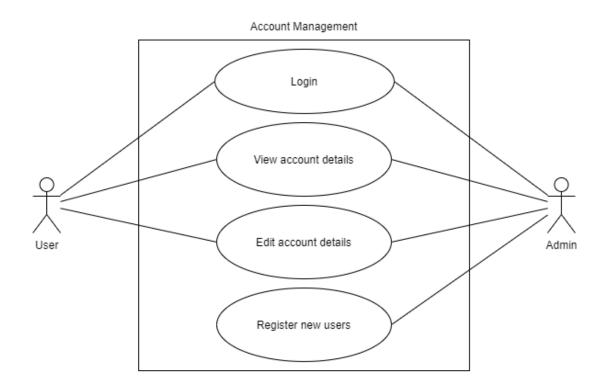

- Able to add new books into the library's book database.
- Able to edit the status of the books.
- Able to register new users.

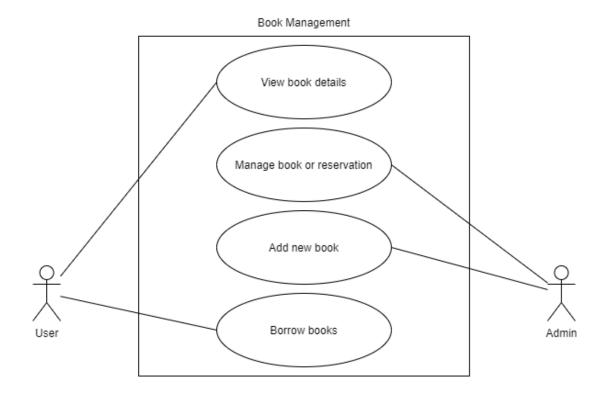

On the other hand, some functions for the 'User' includes:

- Able to view and borrow books that are available.
- Able to edit their user account information. For example, change password, email and phone number.
- Able to view currently borrowed books.

Login page

Error handling: When IC number or password was not entered

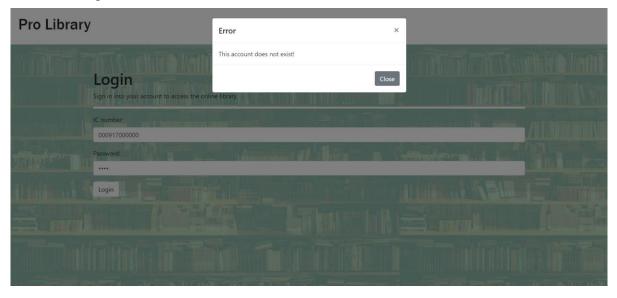

Login page

Error handling: When wrong password entered

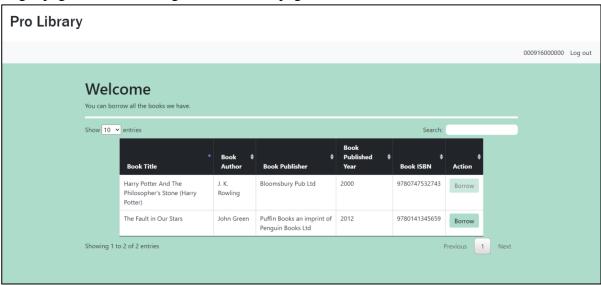

Login page

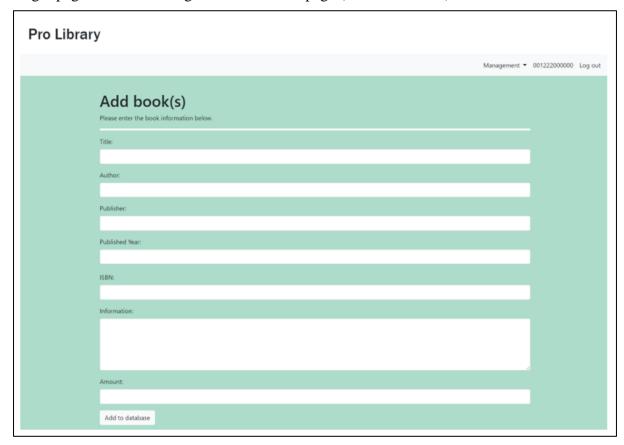

Error handling: When the IC number entered does not exist in the database

Login page - Successful login to user main page

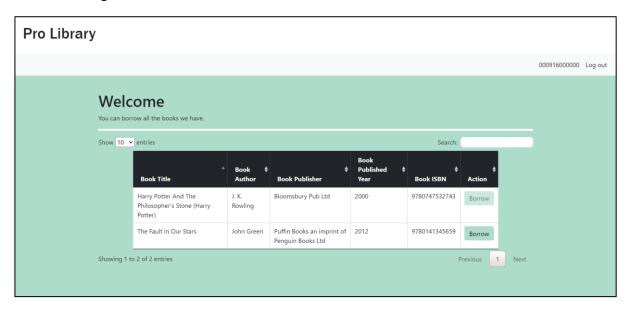

Login page - Successful login to admin main page (Add new books)

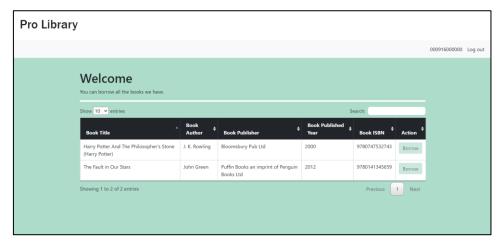

User main page

Error handling: Borrow buttons are disabled if there is no available book to be borrowed

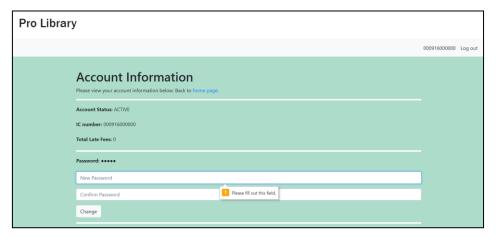

User main page

Error handling: Borrow buttons are disabled for frozen account or maximum books borrowed

User/Admin view account details

Error handling: When user click the "Change" button without entering anything

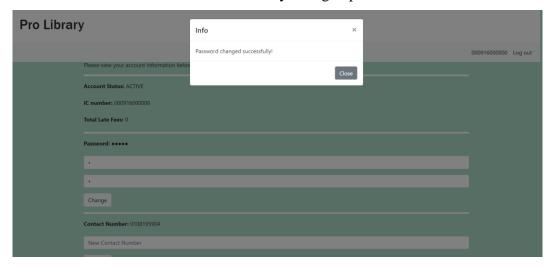

User/Admin view account details

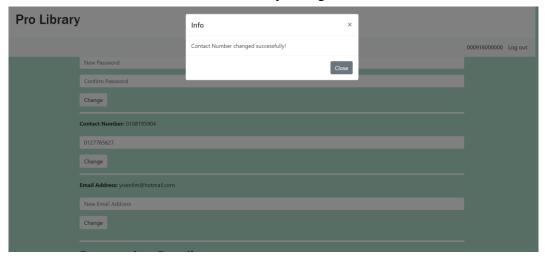

Error handling: When the passwords entered do not match

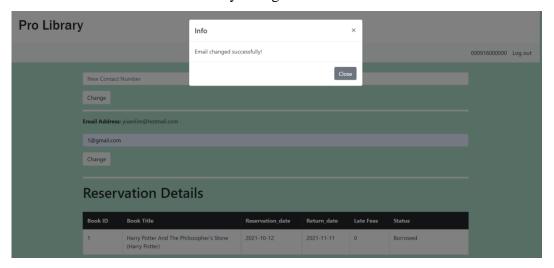

User/Admin view account details - Successfully changed password

User/Admin view account details - Successfully changed contact number

User view account details - Successfully changed email

Admin main page (Add new books)

Error handling: When "Add to database" button is clicked without entering the information

Admin – Manage book and reservation

CONCLUSION

In a nutshell, this project to build a library management system will be extremely useful for librarians to connect with their customers during this pandemic period. This system will be able to lessen the contact time between librarians and the customers and also provide a seamless experience for both parties to conduct their business without having to expose themselves to a high risk of contracting COVID-19. Other future works could be done in order to add more functionality to what this current library management system can do.
